

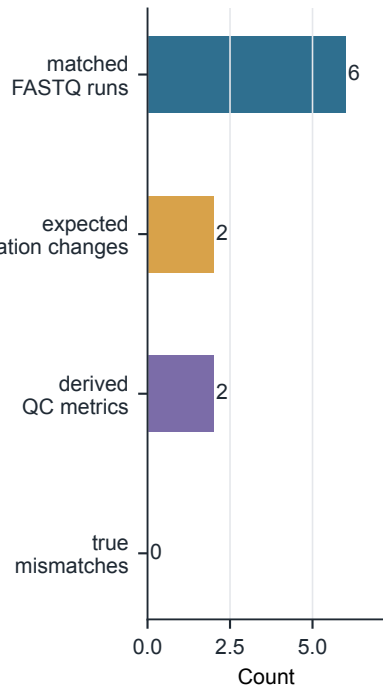

Figure 5 | Reproducibility audit and discrepancy interpretation

A

B

Audit separates matches from expected changes

Matched

FASTQ read counts and source file bytes match public records.

Expected preprocessing change

Peptide-table row count changes because 114 duplicate rows were removed.

Derived QC metric

GC% and read length are Agent-generated QC outputs, not direct paper-reported targets.

Actionable mismatch

A non-zero read-count delta would trigger input, download, and workflow review.

Audit framing prevents expected preprocessing changes from being misreported as failed reproducibility.
